

Introduction to insect identification, sampling and management

Erin Hodgson, Extension Entomologist

Ashley Dean, Extension Entomologist

Outline

- Important insect ID features
- Sampling and recognizing injury
- IPM guidelines

Why are insects unique?

3 body regions

1. Head (1 pair of antennae)
 2. Thorax (3 pairs of legs and 2 pairs of wings)
 3. Abdomen
- *exoskeleton, joints

Why are insects so successful?

- Small size
- Multigenerational
- Flight
- Wide variety of food choices
- Wide variety of habitat resources

Insect metamorphosis

Complete is most common
(egg, larva, pupa, adult)

E.g., beetles, butterflies,
flies, lacewings

*Note larvae and adults look very different;
they often take advantage of totally
different food resources. E.g., larvae are
predators while adults are herbivores.*

Insect metamorphosis

Incomplete is less common
(egg, nymph, adult)

E.g., grasshoppers, true bugs,
aphids, hoppers

*Note nymphs and adults look very similar;
they eat and live in the same area. E.g., both
are predatory or herbivores.*

How to ID insects: wings...most are membranous

How to ID insects: wings...beetles and earwigs have elytra

How to ID insects: wings...true bugs have hemelytra

How to ID insects: wings...grasshoppers have tegmina

How to ID insects: mouthparts

Chewing: grasshoppers, beetles, mantids

Siphoning:
butterflies, moths

Piercing sucking: true
bugs, aphids, mosquito

Chewing lapping:
honey bee

Sponging: house fly

How to ID insects: antennae

bead-like

thread-like

clubbed

filament

elbowed

bristle-like

bristle-like

feathery

How to ID insects: legs

walking

running

grasping

digging

jumping

swimming

Easy to confuse...

Bean leaf beetle

Spotted cucumber beetle/Southern CRW

Striped cucumber beetle

Western corn rootworm

Japanese beetle

False Japanese beetle

Easy to confuse within a family...

Lots of variation within a species...

How to sample insects

Use the “best” collecting method

- Varies depending on target insect
- Estimate density or injury
 - # insects per plant
 - % defoliation
- In-field counts, sweep net

Key points about scouting

- Start looking before you expect them
- Continue sampling regularly
- Try to cover the field
- DON'T avoid and DON'T “eyeball”
- Use a defined walking pattern

Common tools

- Notebook
- Smartphone/tablet
- Hand lens
- Sweep net

Other common sampling methods

sticky cards/
pheromone traps

drop cloth

black light trap

shake bucket

in-field plants

Recognize insect feeding and injury

Recognizing feeding injury

- **Chewing:** remove plant tissue, girdle stems, defoliate, skeletonize leaves, or clip pods
 - Beetles, grasshoppers, caterpillars

Defoliation summary

- Humans tend to over-estimate defoliation
- Calibrate your “eye” every spring to be more accurate
- Defoliation is usually most severe around the perimeter
- Defoliation should be based on whole plants and be field wide

Recognizing feeding injury

- **Piercing-sucking:** feed on phloem and can cause stippling or punctures that result in discoloration or mottling, honeydew
 - Aphids, thrips, spider mites, stink bugs

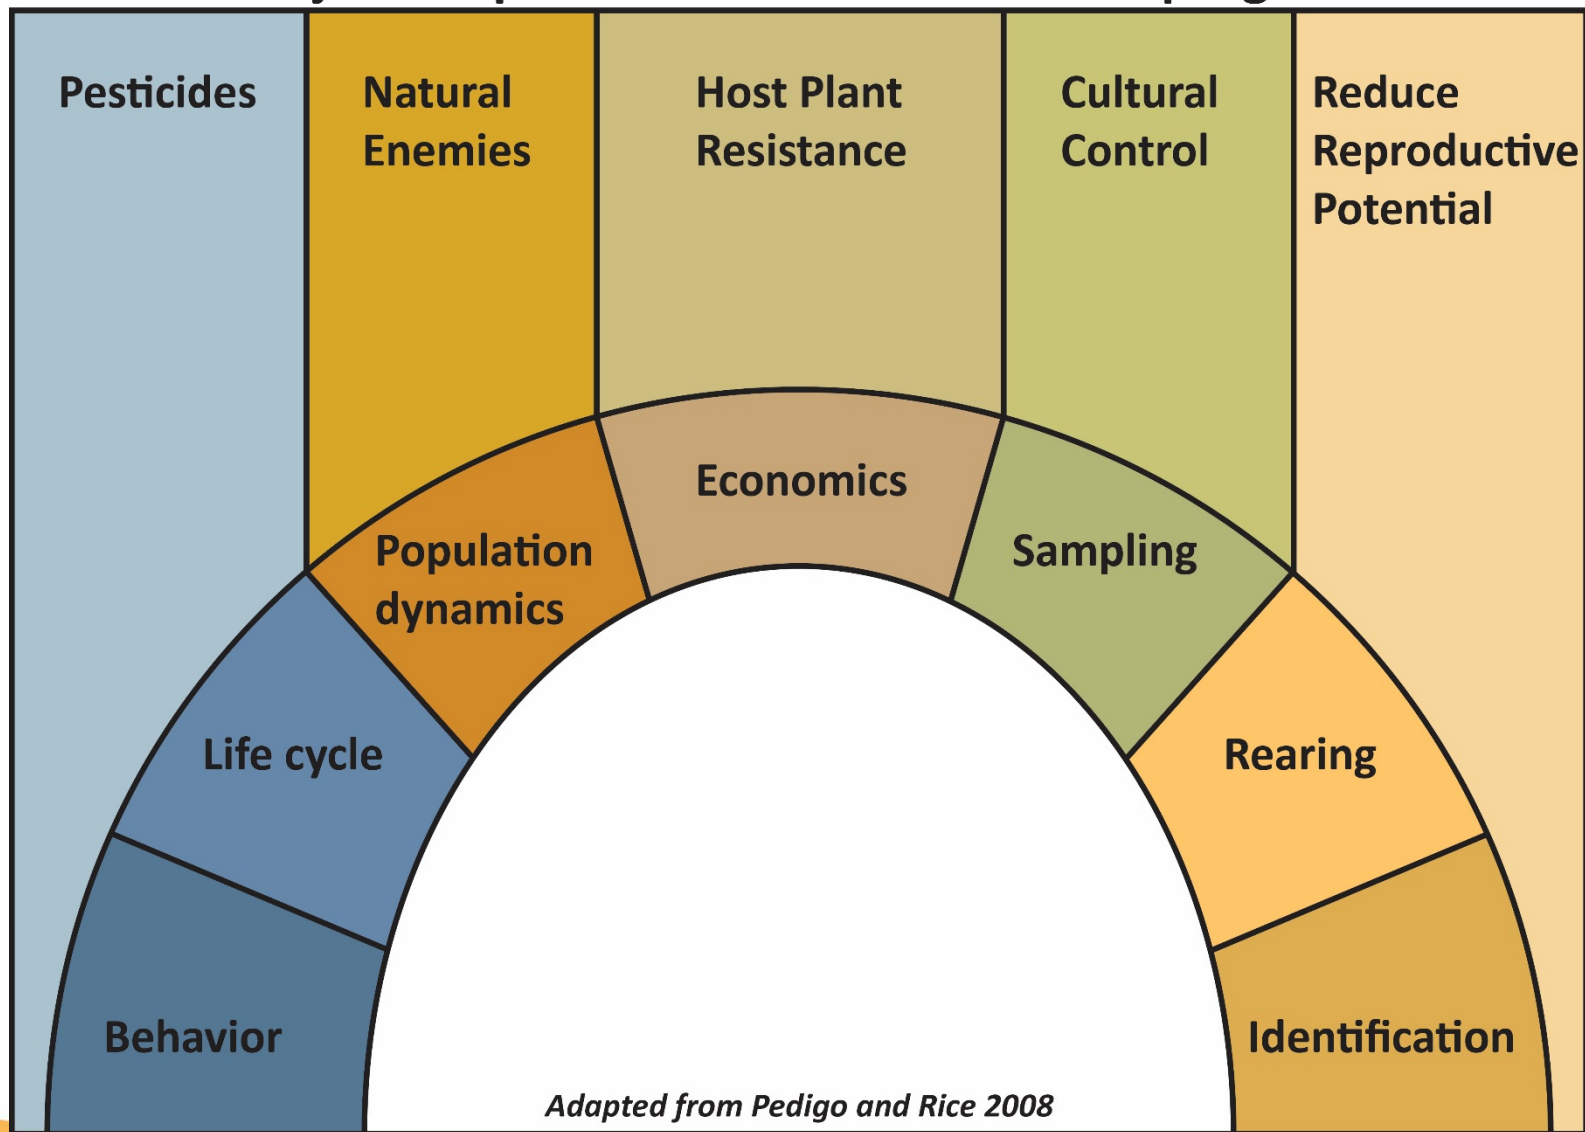

Use IPM guidelines to manage pests

What is IPM?

- Integrated Pest Management
 - Multiple, proactive tactics
 - Suppress pest pressure
 - Sustainable crop production
- More than biological control!

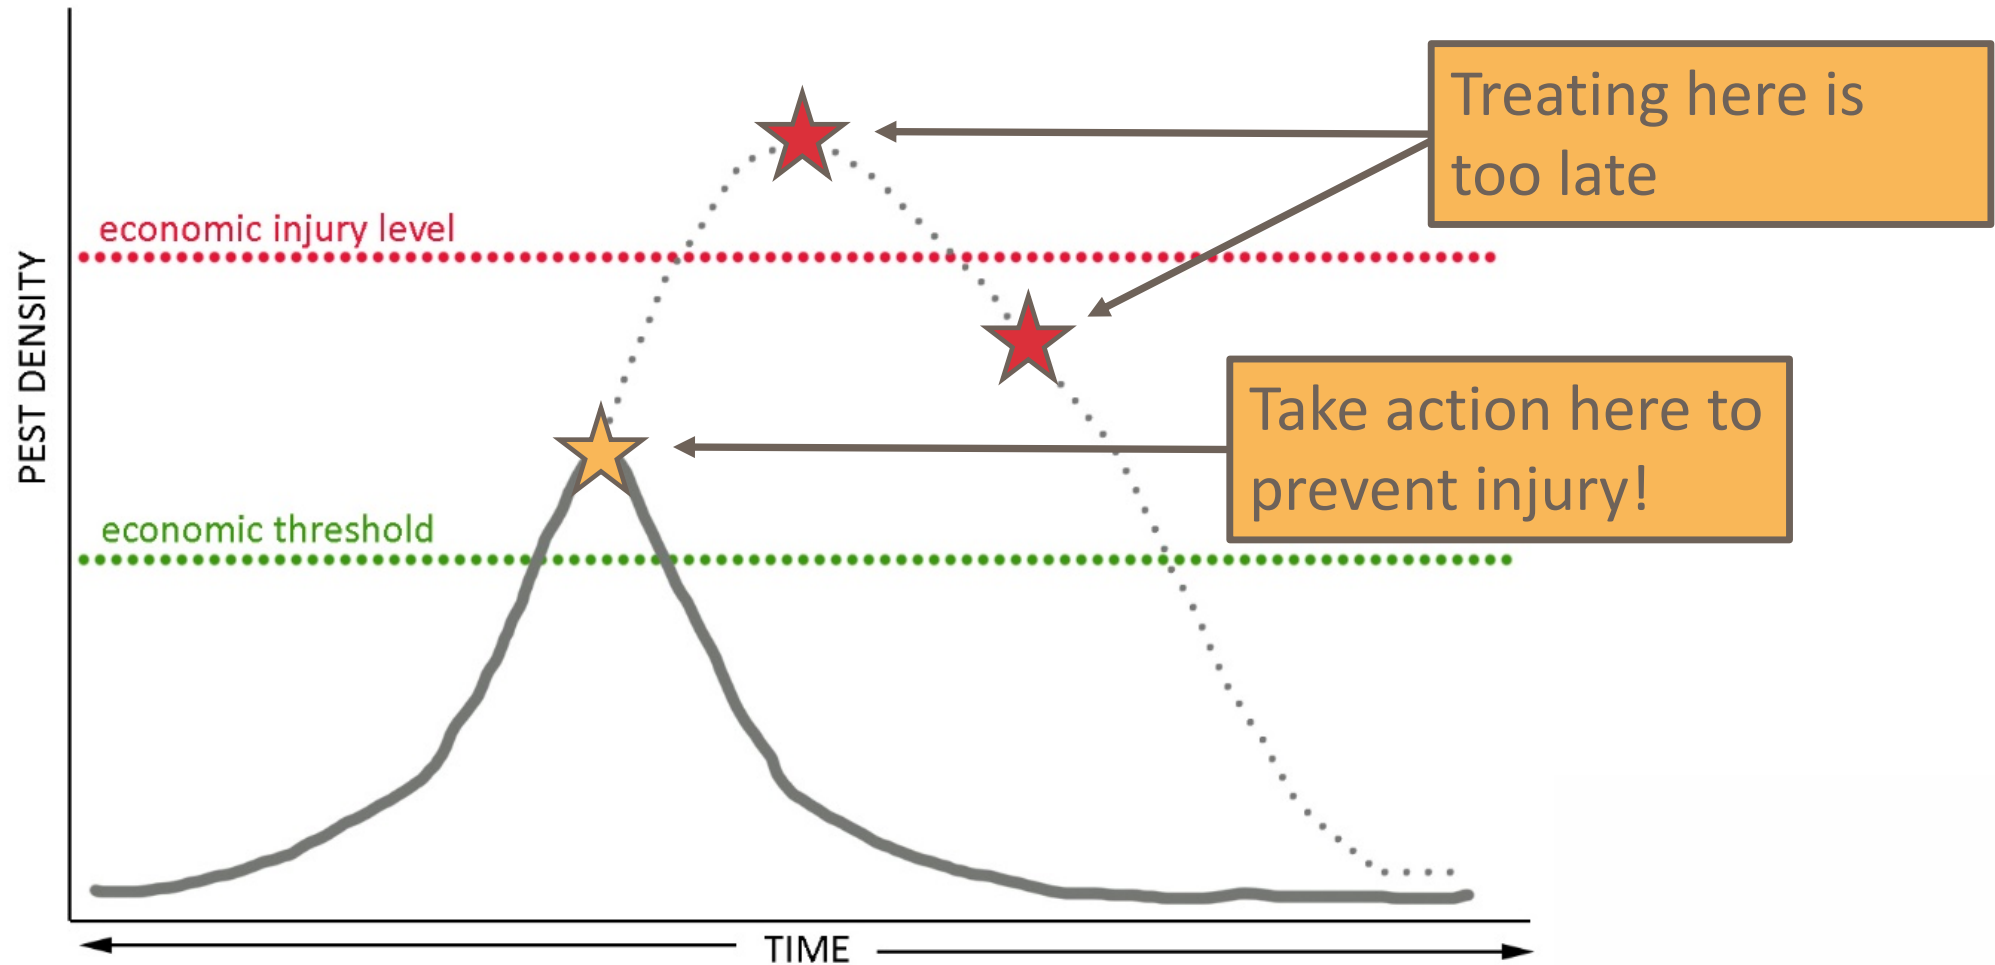

Major components of a successful IPM program

Treatment thresholds

- *Economic injury level*: lowest population density that will cause economic damage
 - E.g., bushels per acre
- *Economic threshold*: point at which action should take place to avoid EIL
 - E.g., pest density or plant injury

Example of an economic threshold

Why use thresholds?

- Minimize input costs
- Protect beneficials and pollinators
- Prevent flares of other pests
- Prolong insecticide efficacy, aka... delay genetic resistance to MOA

Important considerations

- Strive for 100% kill with applications
- Uniform coverage
 - Sufficient volume/pressure
- Be aware of pre-harvest intervals later in season (30d, 45d, 60d)
- Assess product efficacy (check strips!)
- Continue to scout

Take home points

- Use references!
- Know the target pest
 - ID, life cycle, biology
- Know how to sample
 - Recognize injury
 - Time of year, collection method

Integrated Pest Management

Thank you!
